

YATHARTH PATIENT GUIDE

# DEEP BRAIN STIMULATION (DBS) SURGERY

## Guide

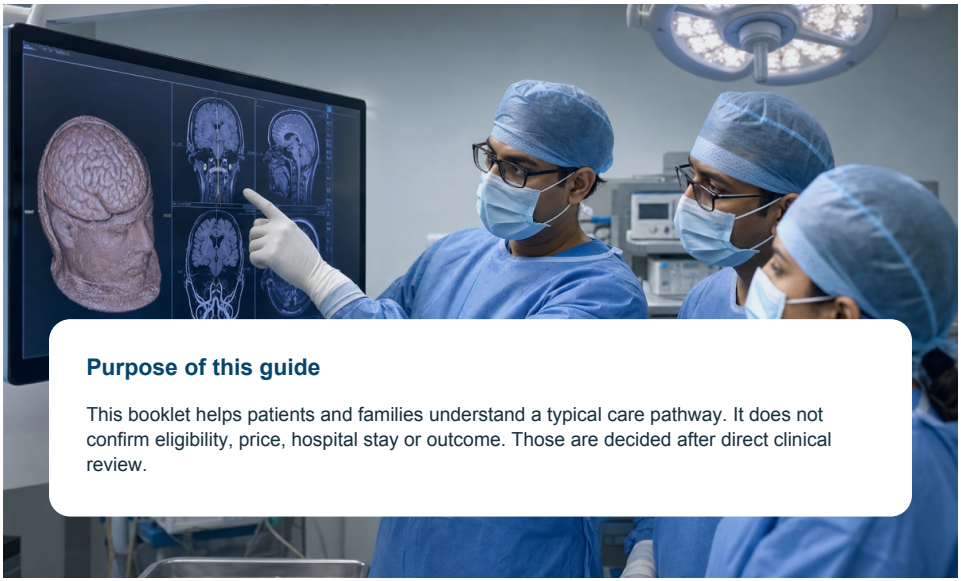

Evaluation, procedure, recovery, international patient planning and package questions.

Yatharth Super Speciality Hospitals | September 2026

INTRODUCTION

# Deep Brain Stimulation (DBS) Surgery

Implantation of electrodes and a pulse generator to modulate selected brain circuits.

### Purpose of this guide

This booklet helps patients and families understand a typical care pathway. It does not confirm eligibility, price, hospital stay or outcome. Those are decided after direct clinical review.

TREATMENT OVERVIEW

# When it may be considered

A specialist confirms the diagnosis and whether this treatment is appropriate.

### Common indications

- Parkinson's disease with medication-responsive symptoms and fluctuations
- Essential tremor
- Selected dystonia
- Other indications only after specialist review

### Treatment types or pathways

- Awake or asleep DBS workflow
- Unilateral or bilateral electrode placement
- Different brain targets selected by diagnosis

**Important**

The presence of an indication does not mean treatment is automatically suitable. Age, anatomy, disease stage, previous treatment, other illnesses and patient preference all matter.

MEDICAL EVALUATION

# Tests and specialist review

The team may add or remove tests based on the patient's condition and proposed treatment.

## Typical evaluation

- Neurology and neurosurgery assessment
- MRI or CT image review
- Medication response and symptom diary
- Neuropsychology or movement testing when indicated
- Routine blood tests and anaesthesia assessment

## Always bring

- Recent doctor notes and diagnosis
- Reports with dates and units
- Imaging reports plus DICOM files when available
- Current medicines, allergies and prior procedures
- Passport details only when required for international-patient processing

BEFORE TREATMENT

# Preparation and admission

Follow only the individualized written instructions issued by the treating and anaesthesia teams.

### Preparation checklist

- Symptoms and treatment goals documented
- Device expectations and alternatives discussed
- Medicine adjustments only as directed
- Imaging-guided surgical plan confirmed
- Programming and long-term follow-up arranged

### Medicines and fasting

Do not stop blood thinners, diabetes medicines, steroids, seizure medicines or other prescribed treatment unless the responsible clinician gives specific instructions.

### Tell the team promptly

Report fever, infection, new breathing trouble, chest pain, pregnancy possibility, recent hospital admission or any major change before travelling or admission.

TREATMENT PLANNING

# How the team selects a pathway

Clinical decisions balance likely benefit, risk, alternatives and the patient's goals.

### Key decision factors

- Confirmed diagnosis
- Symptoms despite optimized medical therapy
- Expected functional benefit
- Imaging and cognitive or psychiatric suitability
- Ability to attend programming and follow-up

### Questions to ask

- What is the goal of this treatment?
- What alternatives are reasonable?
- What result is realistic for this patient?
- What are the major risks and warning signs?
- What would change the plan or total estimate?

PROCEDURE

# How it is usually performed

The final technique, anaesthesia and devices are selected by the treating team.

1. Imaging used to plan the target
2. Electrodes placed through small skull openings
3. Pulse generator implanted under the skin
4. Device programmed after surgery

**Technique may change**

Safety findings during treatment can require a different device, additional procedure, conversion to open surgery, longer monitoring or referral to another specialist.

AFTER TREATMENT

# Recovery, monitoring and follow-up

Discharge depends on clinical milestones, not only a planned number of days.

## Monitoring

- Neurologic examination and wound
- Device function and programming
- Medicine and symptom response
- Mood, cognition and mobility
- Long-term battery and hardware follow-up

## Possible risks

- Bleeding, infection or stroke
- Hardware or lead problems
- Speech, balance or mood changes
- Seizure or neurologic deficit
- Need for reprogramming or revision

### Seek urgent help

Use the hospital's emergency route or nearest emergency service for severe pain, breathing difficulty, heavy bleeding, fainting, new weakness, persistent vomiting, confusion, high fever or rapidly worsening symptoms.

INTERNATIONAL PATIENTS

# Documents to prepare

The hospital team must verify country-specific and treatment-specific requirements before travel.

## Travel documents

- Valid passport for patient and attendant
- Correct medical and attendant visas
- Hospital invitation or support letter
- Recent medical reports in English
- Travel and medical insurance details

## Clinical documents

- Diagnosis and treatment summary
- Imaging files and pathology material if requested
- Current prescriptions and allergy list
- Emergency contact and caregiver details
- Transplant relationship and authorization documents when applicable

### Protect personal information

Share passports and medical records only through the Yatharth channel confirmed for the case. Do not send passwords, payment PINs or unrelated identity documents.

PACKAGE PLANNING

# Hospital stay and inclusions

The surgical admission is followed by staged programming and medicine review. International patients need a clear local and remote follow-up plan.

### Confirm each inclusion in writing

- Treating-team fees specifically listed
- Procedure or test named in the estimate
- Defined room or ICU category and included days
- Routine medicines and consumables listed
- Named implant, device, blood product or special medicine
- Included investigations and follow-up consultations

### A provisional estimate is not a final bill

Changes in diagnosis, medical condition, technique, implant, ICU need or length of stay can change the total. Ask who can approve a revised estimate.

PACKAGE PLANNING

# Common exclusions or additional charges

Exact exclusions depend on the written estimate issued for this patient.

### Check before payment

- Stay beyond the included room or ICU days
- Treatment of complications or unrelated conditions
- Cross-consultations not named in the package
- High-cost medicines, implants or devices not listed
- Additional procedures, investigations or pathology
- Post-discharge medicines, tests or rehabilitation
- Travel, accommodation and companion expenses
- Applicable taxes or payment-processing charges

Keep the estimate, receipts, consent forms, implant labels, discharge summary and final itemized bill.

PLANNING YOUR VISIT

# Financial, visa and accommodation guidance

Confirm arrangements with Yatharth's International Patient Services before booking non-refundable travel.

## Payment

- Confirm currency and estimate validity
- Use hospital-approved payment routes
- Keep proof of every payment

## Visa

- Request the correct hospital support letter
- Use the visa category required for treatment
- Check extension requirements early

## Accommodation

- Choose a stay near the treating hospital
- Confirm accessibility and caregiver needs
- Plan extra days for unexpected review

## Language and food

- Request interpreter support in advance
- Share dietary or religious requirements
- Follow the clinical diet after treatment
