INTRODUCTION

Uterus Removal Surgery (Hysterectomy)

Removal of the uterus for selected benign or cancer-related conditions after discussing alternatives and fertility impact.

Purpose of this guide

This booklet helps patients and families understand a typical care pathway. It does not confirm eligibility, price, hospital stay or outcome. Those are decided after direct clinical review.

TREATMENT OVERVIEW

When it may be considered

A specialist confirms the diagnosis and whether this treatment is appropriate.

Common indications

- Fibroids with significant symptoms
- Abnormal bleeding not controlled otherwise
- Adenomyosis, prolapse or chronic pain in selected cases
- Cancer or pre-cancer treatment

Treatment types or pathways

- Total or subtotal hysterectomy
- Laparoscopic, robotic, vaginal or open approach
- Removal or preservation of ovaries based on indication

Important

The presence of an indication does not mean treatment is automatically suitable. Age, anatomy, disease stage, previous treatment, other illnesses and patient preference all matter.

MEDICAL EVALUATION

Tests and specialist review

The team may add or remove tests based on the patient's condition and proposed treatment.

Typical evaluation

- Blood counts and pregnancy testing when applicable
- Pelvic ultrasound or MRI
- Cervical, endometrial or pathology review when indicated
- Heart and anaesthesia assessment
- Fertility goals and prior surgery reviewed

Always bring

- Recent doctor notes and diagnosis
- Reports with dates and units
- Imaging reports plus DICOM files when available
- Current medicines, allergies and prior procedures
- Passport details only when required for international-patient processing

BEFORE TREATMENT

Preparation and admission

Follow only the individualized written instructions issued by the treating and anaesthesia teams.

Preparation checklist

- Reason for surgery and alternatives discussed
- Effect on fertility and menstruation clarified
- Blood-thinner and diabetes instructions confirmed
- Open, laparoscopic or robotic approach reviewed
- Recovery, lifting and intimacy restrictions explained

Medicines and fasting

Do not stop blood thinners, diabetes medicines, steroids, seizure medicines or other prescribed treatment unless the responsible clinician gives specific instructions.

Tell the team promptly

Report fever, infection, new breathing trouble, chest pain, pregnancy possibility, recent hospital admission or any major change before travelling or admission.

TREATMENT PLANNING

How the team selects a pathway

Clinical decisions balance likely benefit, risk, alternatives and the patient's goals.

Key decision factors

- Symptoms, bleeding and pain
- Size and location of disease
- Fertility and family-planning goals
- Prior treatment response
- Medical fitness and preferred surgical approach

Questions to ask

- What is the goal of this treatment?
- What alternatives are reasonable?
- What result is realistic for this patient?
- What are the major risks and warning signs?
- What would change the plan or total estimate?

PROCEDURE

How it is usually performed

The final technique, anaesthesia and devices are selected by the treating team.

1. Uterus separated from supporting tissues
2. Blood supply controlled
3. Uterus removed through planned approach
4. Specimen sent for pathology

Technique may change

Safety findings during treatment can require a different device, additional procedure, conversion to open surgery, longer monitoring or referral to another specialist.

AFTER TREATMENT

Recovery, monitoring and follow-up

Discharge depends on clinical milestones, not only a planned number of days.

Monitoring

- Bleeding, pain and vital signs
- Urinary and bowel function
- Wound and infection signs
- Mobility and blood-clot prevention
- Pathology and gynaecology follow-up

Possible risks

- Bleeding, infection or blood clots
- Injury to bladder, ureter or bowel
- Adhesions or persistent symptoms
- Effect on fertility depending on procedure
- Need for open or additional surgery

Seek urgent help

Use the hospital's emergency route or nearest emergency service for severe pain, breathing difficulty, heavy bleeding, fainting, new weakness, persistent vomiting, confusion, high fever or rapidly worsening symptoms.

INTERNATIONAL PATIENTS

Documents to prepare

The hospital team must verify country-specific and treatment-specific requirements before travel.

Travel documents

- Valid passport for patient and attendant
- Correct medical and attendant visas
- Hospital invitation or support letter
- Recent medical reports in English
- Travel and medical insurance details

Clinical documents

- Diagnosis and treatment summary
- Imaging files and pathology material if requested
- Current prescriptions and allergy list
- Emergency contact and caregiver details
- Transplant relationship and authorization documents when applicable

Protect personal information

Share passports and medical records only through the Yatharth channel confirmed for the case. Do not send passwords, payment PINs or unrelated identity documents.

PACKAGE PLANNING

Hospital stay and inclusions

Minimally invasive surgery may allow a shorter admission; open or complex surgery requires longer recovery before flying.

Confirm each inclusion in writing

- Treating-team fees specifically listed
- Procedure or test named in the estimate
- Defined room or ICU category and included days
- Routine medicines and consumables listed
- Named implant, device, blood product or special medicine
- Included investigations and follow-up consultations

A provisional estimate is not a final bill

Changes in diagnosis, medical condition, technique, implant, ICU need or length of stay can change the total. Ask who can approve a revised estimate.

PACKAGE PLANNING

Common exclusions or additional charges

Exact exclusions depend on the written estimate issued for this patient.

Check before payment

- Stay beyond the included room or ICU days
- Treatment of complications or unrelated conditions
- Cross-consultations not named in the package
- High-cost medicines, implants or devices not listed
- Additional procedures, investigations or pathology
- Post-discharge medicines, tests or rehabilitation
- Travel, accommodation and companion expenses
- Applicable taxes or payment-processing charges

Keep the estimate, receipts, consent forms, implant labels, discharge summary and final itemized bill.

PLANNING YOUR VISIT

Financial, visa and accommodation guidance

Confirm arrangements with Yatharth's International Patient Services before booking non-refundable travel.

Payment

- Confirm currency and estimate validity
- Use hospital-approved payment routes
- Keep proof of every payment

Visa

- Request the correct hospital support letter
- Use the visa category required for treatment
- Check extension requirements early

Accommodation

- Choose a stay near the treating hospital
- Confirm accessibility and caregiver needs
- Plan extra days for unexpected review

Language and food

- Request interpreter support in advance
- Share dietary or religious requirements
- Follow the clinical diet after treatment
