

YATHARTH PATIENT GUIDE

SPIROMETRY TEST

Guide

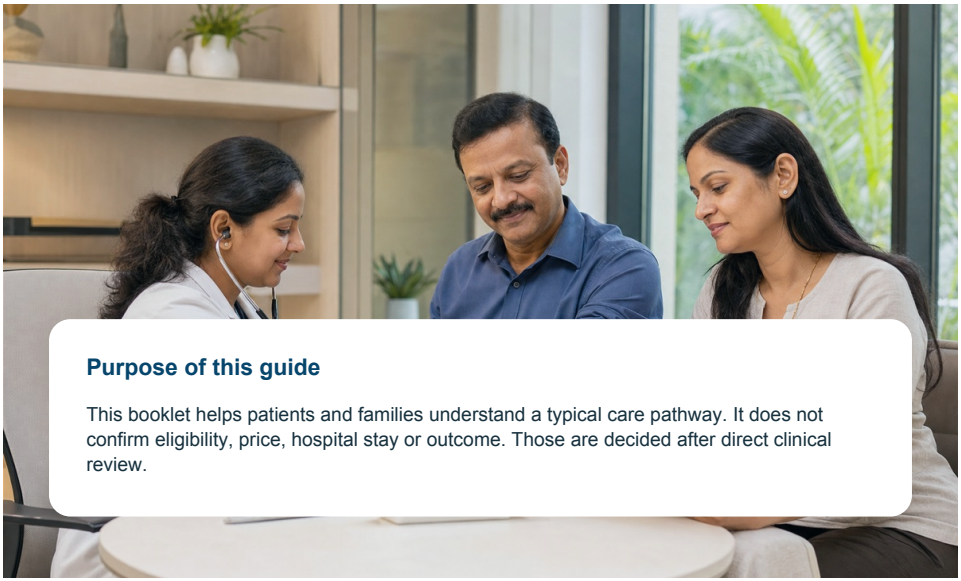

Evaluation, procedure, recovery, international patient planning and package questions.

Yatharth Super Speciality Hospitals | September 2026

INTRODUCTION

Spirometry Test

A breathing test that measures how much and how quickly air can be exhaled.

Purpose of this guide

This booklet helps patients and families understand a typical care pathway. It does not confirm eligibility, price, hospital stay or outcome. Those are decided after direct clinical review.

TREATMENT OVERVIEW

When it may be considered

A specialist confirms the diagnosis and whether this treatment is appropriate.

Common indications

- Suspected asthma or COPD
- Unexplained breathlessness or cough
- Monitoring known lung disease
- Pre-operative respiratory assessment

Treatment types or pathways

- Baseline spirometry
- Pre- and post-bronchodilator testing
- Serial monitoring

Important

The presence of an indication does not mean treatment is automatically suitable. Age, anatomy, disease stage, previous treatment, other illnesses and patient preference all matter.

MEDICAL EVALUATION

Tests and specialist review

The team may add or remove tests based on the patient's condition and proposed treatment.

Typical evaluation

- Respiratory history and examination
- Current inhalers and recent infection review
- Oxygen saturation and chest imaging when indicated
- Allergy and medicine review
- Sleep or lung-function questionnaire

Always bring

- Recent doctor notes and diagnosis
- Reports with dates and units
- Imaging reports plus DICOM files when available
- Current medicines, allergies and prior procedures
- Passport details only when required for international-patient processing

BEFORE TREATMENT

Preparation and admission

Follow only the individualized written instructions issued by the treating and anaesthesia teams.

Preparation checklist

- Follow test-specific inhaler instructions only from the team
- Avoid heavy meals or stimulants if instructed
- Bring CPAP or respiratory devices when requested
- Wear comfortable clothing
- Report current infection or worsening breathlessness

Medicines and fasting

Do not stop blood thinners, diabetes medicines, steroids, seizure medicines or other prescribed treatment unless the responsible clinician gives specific instructions.

Tell the team promptly

Report fever, infection, new breathing trouble, chest pain, pregnancy possibility, recent hospital admission or any major change before travelling or admission.

TREATMENT PLANNING

How the team selects a pathway

Clinical decisions balance likely benefit, risk, alternatives and the patient's goals.

Key decision factors

- Symptoms and clinical question
- Ability to perform breathing manoeuvres
- Need for daytime lung-function or overnight sleep testing
- Current respiratory stability
- How results will change treatment

Questions to ask

- What is the goal of this treatment?
- What alternatives are reasonable?
- What result is realistic for this patient?
- What are the major risks and warning signs?
- What would change the plan or total estimate?

PROCEDURE

How it is usually performed

The final technique, anaesthesia and devices are selected by the treating team.

1. Nose clip and mouthpiece fitted
2. Patient breathes in fully
3. Air blown out hard and fast
4. Several acceptable attempts recorded

Technique may change

Safety findings during treatment can require a different device, additional procedure, conversion to open surgery, longer monitoring or referral to another specialist.

AFTER TREATMENT

Recovery, monitoring and follow-up

Discharge depends on clinical milestones, not only a planned number of days.

Monitoring

- Test quality and repeatability
- Oxygen level and symptoms
- Sleep stages and breathing events when applicable
- Final specialist interpretation
- Treatment and device follow-up

Possible risks

- Temporary breathlessness, cough or dizziness
- Skin irritation from sensors
- Poor sleep or incomplete recording
- Need to repeat an inadequate study
- Unexpected low oxygen requiring medical review

Seek urgent help

Use the hospital's emergency route or nearest emergency service for severe pain, breathing difficulty, heavy bleeding, fainting, new weakness, persistent vomiting, confusion, high fever or rapidly worsening symptoms.

INTERNATIONAL PATIENTS

Documents to prepare

The hospital team must verify country-specific and treatment-specific requirements before travel.

Travel documents

- Valid passport for patient and attendant
- Correct medical and attendant visas
- Hospital invitation or support letter
- Recent medical reports in English
- Travel and medical insurance details

Clinical documents

- Diagnosis and treatment summary
- Imaging files and pathology material if requested
- Current prescriptions and allergy list
- Emergency contact and caregiver details
- Transplant relationship and authorization documents when applicable

Protect personal information

Share passports and medical records only through the Yatharth channel confirmed for the case. Do not send passwords, payment PINs or unrelated identity documents.

PACKAGE PLANNING

Hospital stay and inclusions

Spirometry is usually a brief outpatient test; polysomnography generally requires an overnight monitored stay.

Confirm each inclusion in writing

- Treating-team fees specifically listed
- Procedure or test named in the estimate
- Defined room or ICU category and included days
- Routine medicines and consumables listed
- Named implant, device, blood product or special medicine
- Included investigations and follow-up consultations

A provisional estimate is not a final bill

Changes in diagnosis, medical condition, technique, implant, ICU need or length of stay can change the total. Ask who can approve a revised estimate.

PACKAGE PLANNING

Common exclusions or additional charges

Exact exclusions depend on the written estimate issued for this patient.

Check before payment

- Stay beyond the included room or ICU days
- Treatment of complications or unrelated conditions
- Cross-consultations not named in the package
- High-cost medicines, implants or devices not listed
- Additional procedures, investigations or pathology
- Post-discharge medicines, tests or rehabilitation
- Travel, accommodation and companion expenses
- Applicable taxes or payment-processing charges

Keep the estimate, receipts, consent forms, implant labels, discharge summary and final itemized bill.

PLANNING YOUR VISIT

Financial, visa and accommodation guidance

Confirm arrangements with Yatharth's International Patient Services before booking non-refundable travel.

Payment

- Confirm currency and estimate validity
- Use hospital-approved payment routes
- Keep proof of every payment

Visa

- Request the correct hospital support letter
- Use the visa category required for treatment
- Check extension requirements early

Accommodation

- Choose a stay near the treating hospital
- Confirm accessibility and caregiver needs
- Plan extra days for unexpected review

Language and food

- Request interpreter support in advance
- Share dietary or religious requirements
- Follow the clinical diet after treatment
