

YATHARTH PATIENT GUIDE

THROMBECTOMY

Guide

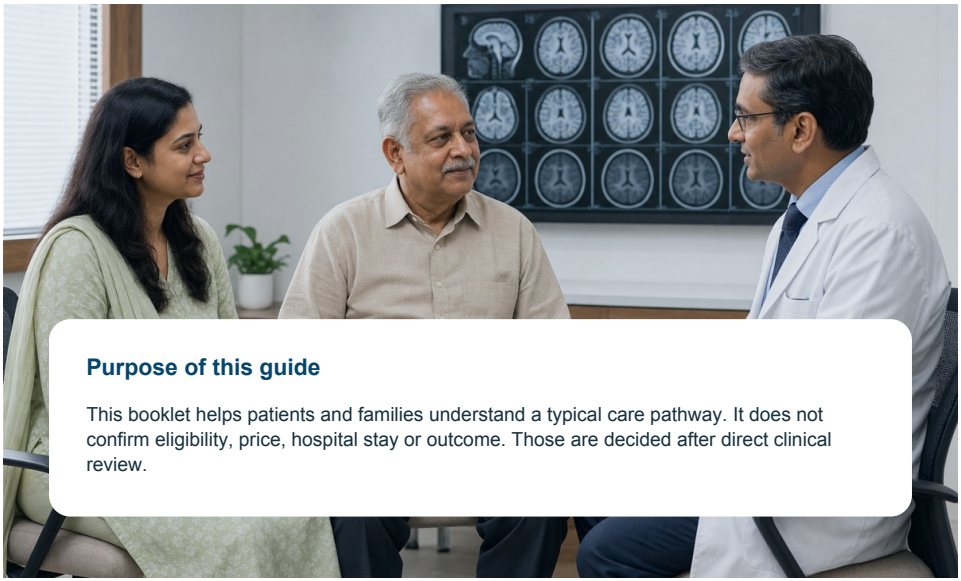

Evaluation, procedure, recovery, international patient planning and package questions.

Yatharth Super Speciality Hospitals | September 2026

INTRODUCTION

Thrombectomy

Urgent catheter or surgical removal of a blood clot in selected blocked vessels, including certain strokes.

Purpose of this guide

This booklet helps patients and families understand a typical care pathway. It does not confirm eligibility, price, hospital stay or outcome. Those are decided after direct clinical review.

TREATMENT OVERVIEW

When it may be considered

A specialist confirms the diagnosis and whether this treatment is appropriate.

Common indications

- Large-vessel ischaemic stroke within suitable criteria
- Selected limb or other arterial blockage
- Severe symptoms with salvageable tissue
- Imaging confirming a treatable clot

Treatment types or pathways

- Mechanical catheter thrombectomy
- Aspiration or device-assisted clot removal
- Surgical thrombectomy in selected vessels

Important

The presence of an indication does not mean treatment is automatically suitable. Age, anatomy, disease stage, previous treatment, other illnesses and patient preference all matter.

MEDICAL EVALUATION

Tests and specialist review

The team may add or remove tests based on the patient's condition and proposed treatment.

Typical evaluation

- ECG and echocardiography
- Blood counts, kidney function and clotting tests
- Coronary imaging or angiography when indicated
- Chest imaging and anaesthesia assessment
- Review of diabetes and blood-thinner medicines

Always bring

- Recent doctor notes and diagnosis
- Reports with dates and units
- Imaging reports plus DICOM files when available
- Current medicines, allergies and prior procedures
- Passport details only when required for international-patient processing

BEFORE TREATMENT

Preparation and admission

Follow only the individualized written instructions issued by the treating and anaesthesia teams.

Preparation checklist

- Symptoms and prior cardiac events documented
- Current medicines reconciled
- Allergies and kidney risks discussed
- Fasting and medicine instructions provided by the team
- Consent includes planned treatment and alternatives

Medicines and fasting

Do not stop blood thinners, diabetes medicines, steroids, seizure medicines or other prescribed treatment unless the responsible clinician gives specific instructions.

Tell the team promptly

Report fever, infection, new breathing trouble, chest pain, pregnancy possibility, recent hospital admission or any major change before travelling or admission.

TREATMENT PLANNING

How the team selects a pathway

Clinical decisions balance likely benefit, risk, alternatives and the patient's goals.

Key decision factors

- Symptoms and severity of blocked or diseased vessels
- Heart function and valve status
- Anatomy and number of vessels involved
- Other illnesses and surgical risk
- Expected benefit versus medicines or alternative procedures

Questions to ask

- What is the goal of this treatment?
- What alternatives are reasonable?
- What result is realistic for this patient?
- What are the major risks and warning signs?
- What would change the plan or total estimate?

PROCEDURE

How it is usually performed

The final technique, anaesthesia and devices are selected by the treating team.

1. Emergency imaging and team assessment
2. Catheter guided to the blocked vessel
3. Clot removed or flow restored
4. Stroke or vascular unit monitoring follows

Technique may change

Safety findings during treatment can require a different device, additional procedure, conversion to open surgery, longer monitoring or referral to another specialist.

AFTER TREATMENT

Recovery, monitoring and follow-up

Discharge depends on clinical milestones, not only a planned number of days.

Monitoring

- Heart rhythm, blood pressure and oxygen
- Access site or surgical wound
- Kidney function and blood counts
- Walking and breathing exercises
- Cardiac rehabilitation and medicine review

Possible risks

- Bleeding or access-site complications
- Contrast-related kidney injury
- Rhythm problems, heart attack or stroke
- Infection or blood clots
- Need for urgent surgery or further intervention

Seek urgent help

Use the hospital's emergency route or nearest emergency service for severe pain, breathing difficulty, heavy bleeding, fainting, new weakness, persistent vomiting, confusion, high fever or rapidly worsening symptoms.

INTERNATIONAL PATIENTS

Documents to prepare

The hospital team must verify country-specific and treatment-specific requirements before travel.

Travel documents

- Valid passport for patient and attendant
- Correct medical and attendant visas
- Hospital invitation or support letter
- Recent medical reports in English
- Travel and medical insurance details

Clinical documents

- Diagnosis and treatment summary
- Imaging files and pathology material if requested
- Current prescriptions and allergy list
- Emergency contact and caregiver details
- Transplant relationship and authorization documents when applicable

Protect personal information

Share passports and medical records only through the Yatharth channel confirmed for the case. Do not send passwords, payment PINs or unrelated identity documents.

PACKAGE PLANNING

Hospital stay and inclusions

Same-day care may be possible for selected tests; interventions and surgery need longer observation. The cardiology team confirms travel timing.

Confirm each inclusion in writing

- Treating-team fees specifically listed
- Procedure or test named in the estimate
- Defined room or ICU category and included days
- Routine medicines and consumables listed
- Named implant, device, blood product or special medicine
- Included investigations and follow-up consultations

A provisional estimate is not a final bill

Changes in diagnosis, medical condition, technique, implant, ICU need or length of stay can change the total. Ask who can approve a revised estimate.

PACKAGE PLANNING

Common exclusions or additional charges

Exact exclusions depend on the written estimate issued for this patient.

Check before payment

- Stay beyond the included room or ICU days
- Treatment of complications or unrelated conditions
- Cross-consultations not named in the package
- High-cost medicines, implants or devices not listed
- Additional procedures, investigations or pathology
- Post-discharge medicines, tests or rehabilitation
- Travel, accommodation and companion expenses
- Applicable taxes or payment-processing charges

Keep the estimate, receipts, consent forms, implant labels, discharge summary and final itemized bill.

PLANNING YOUR VISIT

Financial, visa and accommodation guidance

Confirm arrangements with Yatharth's International Patient Services before booking non-refundable travel.

Payment

- Confirm currency and estimate validity
- Use hospital-approved payment routes
- Keep proof of every payment

Visa

- Request the correct hospital support letter
- Use the visa category required for treatment
- Check extension requirements early

Accommodation

- Choose a stay near the treating hospital
- Confirm accessibility and caregiver needs
- Plan extra days for unexpected review

Language and food

- Request interpreter support in advance
- Share dietary or religious requirements
- Follow the clinical diet after treatment
